Module 04

Team Assignment: Design

Learning Objectives

QM 1.4, 3.1, 3.3, 3.4, 5.1, 5.2, 5.4

- Identify relationships between classes.
- Collaborate with others by exchanging ideas, building consensus, and practicing teamwork skills.
- Manage your time to complete assigned tasks according to project milestones.
- Communicate professionally.

Overview

This assignment is the first part and the design phase of the multi-week team project.

Here is a description of the team project: [Team Project Description. \(https://slcc.instructure.com/courses/1272217/pages/team-project-description\)](https://slcc.instructure.com/courses/1272217/pages/team-project-description)

In this first stage, you are going to plan and design a project from scratch that you'll implement in weeks 2 and 3.

No code should be written at this stage.

(<https://slcc.instructure.com/courses/1272217/pages/team-project-description>) Please read the **Collaboration Guidelines** posted under [Guidelines and Expectations \(https://slcc.instructure.com/courses/1272217/pages/guidelines-and-expectations\)](https://slcc.instructure.com/courses/1272217/pages/guidelines-and-expectations) > **Collaboration tab** to ensure a shared understanding of what it takes to be a good team partner.

Students are paired up with a partner. Please reach out to your partner as soon as you can and schedule the first meeting. Having that first meeting planned sets the tone for a productive collaboration.

Instruction

1. **Contact your team partner and schedule your first meeting.**
2. **Read the [Team Project Description \(https://slcc.instructure.com/courses/1272217/pages/team-project-description\)](https://slcc.instructure.com/courses/1272217/pages/team-project-description)**
3. **Together, decide what project you want to work on and describe it**
Write a clear and descriptive paragraph that provides a good overview of the project.
4. **Create a prototype that demonstrates how the user interacts with the program.**
This is the time to decide how the program represents information/data, and how the user interacts with it. The prototype should provide a comprehensive overview of all major user interactions. Avoid using pop-up windows for typical user interaction. Pop-ups (modals) are best used when it is critical to get the user's attention. E.g., to verify that the user wants to delete a selected file.
Below are three different ways to create a prototype. Choose what works best for your project.
 - The prototype can be a set of slides that show all the different 'screens' and major user interactions.
 - It can be a paper prototype (see video below)

윤석찬 (Channy Yun)

Watch on

- Those of you who love technology could also create a polished and professional-looking prototype using wireframe software like [Balsamiq. \(https://balsamiq.com/products/mockups/\)](https://balsamiq.com/products/mockups/)

5. **Write UML class diagrams** to specify what classes you are going to use in your implementation.

Make sure to include classes and methods that can provide all the functionality described in the paragraph and the prototype above.

There is no need to include private methods in the UML class diagram. Public methods, constructors, and fields, are all we need for our purpose.

Choose descriptive names

Carefully decide which **parameters and return types** are needed so classes can work together to provide the desired functionality; include them in the UML class diagram.

Use appropriate arrows and multiplicity to indicate the relationship between classes (e.g., inheritance uses hollow arrow-heads while associations don't, etc.)

Choosing classes is a very important step in object-oriented design that has a profound impact on how easy or hard the implementation will be. **It needs to be done collaboratively with the input of all team members.**

[Strive for cohesion \(http://stackoverflow.com/questions/10830135/what-is-high-cohesion-and-how-to-use-it-make-it\)](http://stackoverflow.com/questions/10830135/what-is-high-cohesion-and-how-to-use-it-make-it).

6. **Record a video.**

If possible, create the video together. E.g., by recording an online meeting all team members are participating in.

The video should be **2 - 5 minutes** long and it should include the following:

- A. A title page and a brief introduction that lists the names of the project and the team members
- B. The paragraph
The video should show the paragraph that describes the project and one team member should **read it out loud**.
- C. The prototype

Use the prototype to provide an overview of your project and to demonstrate how users interact with your program.

D. UML Class Diagrams

Show the UML class diagrams and describe how the classes work together.

E. Describe the Teamwork | Collaboration

To describe the teamwork and collaboration, answer the following questions:

- I. How often did your team meet on this part of the assignment and how much time did your team spend approximately in total?
- II. Did your team clearly divide up the work between team members and set clear timelines when individual work needed to be completed?
- III. Were team members responsive and respectful of other people's ideas?
- IV. What was the most challenging part for your team?
- V. Briefly describe the work distribution. Did each team member contribute to the design in a significant way?
- VI. Include the pebble distribution.

The [pebble distribution \(https://slcc.instructure.com/courses/1272217/pages/pebble-distribution\)](https://slcc.instructure.com/courses/1272217/pages/pebble-distribution) should have been discussed with the team before including it in the video. If the pebble distribution is uneven, describe the reason why.

Submission

One team member embeds the video as described above.

Each team member posts a note that lists the project name, the name of the team partner(s), and the discussed pebble distribution.
