Module 05

Team Assignment - Significant Progress

Learning Objectives

QM 1.4, 3.1, 3.3, 3.4, 5.1, 5.2, 5.4

- Implement relationships between classes.
- Design, implement, and test a substantial program using the object-oriented paradigm.
- Collaborate with others by exchanging ideas, building consensus, and practicing teamwork skills.
- Communicate professionally.

Overview

This assignment is the second phase of the team assignment. It requires the demonstration of significant progress toward the team project and is intended to help the teams stay on track to successfully complete on time. After this second phase, about half of the project should be implemented and working.

Here are for your reference the [Team Project Description \(https://slcc.instructure.com/courses/1272217/pages/team-project-description\)](https://slcc.instructure.com/courses/1272217/pages/team-project-description) and the [Guidelines and Expectations \(https://slcc.instructure.com/courses/1272217/pages/guidelines-and-expectations\)](https://slcc.instructure.com/courses/1272217/pages/guidelines-and-expectations) with

I.

Instruction

1. **Work on the implementation of your team project.**

At the end of this phase, about half of the project should be implemented and working. Each team member is expected to contribute to the code in a significant way. Remember that CSIS offers free [Java tutoring \(http://www.slcc.edu/csis/tutoring.aspx\)](http://www.slcc.edu/csis/tutoring.aspx) if you need help.

- Together with your team partner(s), identify the core of the project - the most important parts that need to be completed in order to have a viable project. Focus your progress on those most important parts.
- Together, identify the classes, methods, etc. that you are going to implement and divide up the work.
- Set deadlines when the individual methods/classes need to be completed and shared.
- Make sure each team member knows what his/her responsibility is and how to get started.
- Check whether anyone on your team anticipates a difficulty. If that is the case, brainstorm what can be done to overcome it. If you encounter an obstacle your team cannot overcome, contact your instructor.

2. **Together with your partner(s), record a video**

The video should be 2 - 5 minutes long and it should include the following:

- A. A title page and a brief introduction that lists the names of the project and the team members
- B. An overview of the code written

All the code files should be already open and positioned at the top so the doc comments that list the authors can be seen. Scroll down the code from top to bottom while providing an overview of who worked on which parts of the code.
- C. Demonstrate that there are no compile errors.

If you have some code in progress that doesn't work yet, comment it out temporarily.
- D. Run the code

At this halfway point, the project won't be finished.
Use your test code to execute the parts of the project that have been implemented and demonstrate that they work.

E. Describe your Teamwork | Collaboration

To describe the teamwork and collaboration, answer the following questions:

- I. How often did your team meet on this part of the assignment and how much time did your team spend approximately in total?
- II. Did your team clearly divide up the work between team members and set clear timelines when individual work needed to be completed?
- III. Were team members responsive and respectful of other people's ideas?
- IV. What was the most challenging part for your team?
- V. Briefly describe the work distribution. Did each team member contribute to the design in a significant way?
- VI. Include the pebble distribution.

The [pebble distribution \(https://slcc.instructure.com/courses/1272217/pages/pebble-distribution\)](https://slcc.instructure.com/courses/1272217/pages/pebble-distribution) should have been discussed with the team before including it in the video. If the pebble distribution is uneven, describe the reason why.

Submission

One team member turns in the video as described above.

Each team member submits the project name, the names of the partners, and the discussed pebble distribution. If the pebbles are not equally distributed, explain why.
