Module 06

Team Assignment: Project

Learning Objectives

QM 1.4, 3.1, 3.3, 3.5, 5.1, 5.2, 5.4

- Implement relationships between classes.
- Design, implement, and test a substantial program using the object-oriented paradigm.
- Collaborate with others by exchanging ideas, building consensus, and practicing teamwork skills
- Manage your time to complete assigned tasks according to project milestones.
- Present the project to a wider audience.
- Communicate professionally.

Overview

This is the third and last phase of the team assignment when you complete your project.

As part of the team assignment, you are asked to create **two videos** for two different audiences:

1. One video is for grading. That's where you demonstrate that the requirements of the

assignment are met.

2. The second video shows off the highlights of your project. It should have presentation quality and it will be shared with your classmates.

Instruction

1. **Complete the project code.**

Each team member is expected to contribute significantly to the implementation and testing.

- Together with your team partner(s), identify which requirements are still missing. Here is a link to the [Team Project Description \(https://slcc.instructure.com/courses/1272217/pages/team-project-description\)](https://slcc.instructure.com/courses/1272217/pages/team-project-description)
- Divide up the work among the team members.
- Set deadlines by when the individual code needs to be completed and shared. Allow plenty of time for integration and testing.
- Make sure each team member knows what his/her responsibility is and how to get started
- It is easy to run out of time. Allow plenty of time to integrate the various parts into one project and to test the finished project.
- Check whether anyone on your team anticipates a difficulty. If that is the case, brainstorm what can be done to overcome it. If you encounter an obstacle your team cannot overcome, contact your instructor.

2. **Test** your project thoroughly

In addition to testing the individual methods and classes, verify that the finished program works as expected.

3. Create a **video for grading**.

The video should be 2 - 5 minutes long and it should include the following:

- A. A title page and a brief introduction that lists the names of the project and the team members
- B. Evidence that the requirements are met
Point out how the [Design/Code Requirements A - D \(https://slcc.instructure.com/courses/1272217/pages/team-project-description\)](https://slcc.instructure.com/courses/1272217/pages/team-project-description) are met. If a requirement is missing, point that out as well.
- C. An overview of the code written since the significant progress submission.

All the code files should be already open and positioned at the top so the doc comments that list the authors can be seen. Scroll down the code from top to bottom while providing an overview of who worked on which parts of the code.

D. Run the code

Demonstrate that the program works as expected. If the program is a game that takes a long time, show the start, the middle, and the end.

E. Describe your Teamwork | Collaboration

To describe the teamwork and collaboration, answer the following questions:

1. How often did your team meet on this part of the assignment and how much time did your team spend approximately in total?
2. Did your team clearly divide up the work between team members and set clear timelines when individual work needed to be completed?
3. Were team members responsive and respectful of other people's ideas?
4. What was the most challenging part for your team?
5. Briefly describe the work distribution. Did each team member contribute to the design in a significant way?
6. Include the pebble distribution.

The [pebble distribution \(https://slcc.instructure.com/courses/1272217/pages/pebble-distribution\)](https://slcc.instructure.com/courses/1272217/pages/pebble-distribution) should have been discussed with the team before including it in the video. If the pebble distribution is uneven, describe the reason why.

4. Create a **second video** that will be shared with everyone in the class.

This second video should demonstrate your professionalism. It should have the **best presentation quality** you can produce.

For expectations and requirements, please read the [Guidelines for Presentation Recording \(https://slcc.instructure.com/courses/1272217/pages/guidelines-for-presentation-recording\)](https://slcc.instructure.com/courses/1272217/pages/guidelines-for-presentation-recording)

Submission

One team member turns in the following three items:

- The video for grading
- The Youtube link of the video that will be shared with the class
- A running JAR file that includes the source code and all resource files of your project

Each team member submits the project name, the names of the partners, and the discussed pebble distribution. If the pebbles are not equally distributed, explain why.
