

Team Project Description

Overview:

This assignment is a team assignment. In order to earn full points, it needs to be completed as a team (preferably 2 maximum 3 people per team)

Together with your teammate(s) decide what program you would like to write. This is your opportunity to show off what you can do. It should be something interesting, something that demonstrates your Java skills - something fun. In the end, each team will create a screen recording where it presents the finished project to the class.

Design/Code Requirements:

1. Each project needs to be **designed from scratch** and it needs to be written in Java.
2. Each project needs to include the following:
 - A. a minimum of **three classes**
 - B. a **graphical user interface**
 - C. a **generic collection**
 - D. **file IO** (It needs to read from and write to a file)
3. The **scope** of each project needs to be about 1.5 times the scope of an average weekly assignment per individual. This means that for a team of two, the scope of the project needs to be about 3 times the scope of a typical CSIS 1410 assignment. This allows some extra time for coordinating and communicating.
4. In order to earn full points, each team member needs to **contribute to the design and implementation** in a significant way on every submission.

The better your design and coding practices, the easier the implementation. Here are some things to keep in mind as you work on your project: Try to separate functionality from the display.

Refactor early on by extracting private methods to structure your code and ensuring names are clear and descriptive. Pay special attention to style and proper documentation. Also: avoid code repetition and overly long methods.

Team Requirements:

- A. Be responsive and respectful of other people's ideas
- B. Stay in frequent contact with your partner.
- C. Clearly divide up the work between the team members (e.g. who is responsible for which

class, for which method etc.)

D. Set clear timelines when individual work needs to be completed and allocate time to merge the code

E. Complete your assigned work on time

If you need help, talk to your partner early on. Together you might be able to come up with a plan or a solution. If you encounter coding issues, get help from our Java tutors. If difficulties persist, reach out to your instructor for help.

F. Provide honest and accurate feedback to your team partner(s) early on, and discuss the pebble distribution before each submission.

Submissions:

In order to help the teams keep on track, this assignment has multiple milestones, each with its own Canvas submission. Note, that there is only a limited time to submit the work of a given milestone. Meeting those milestones is important to keep the project on track and to earn the points of the given milestone.

Please read the submission requirements carefully. Some might ask you to turn in a video, others to submit code. All submissions ask for a team evaluation and pebble distribution.
